

## Electronic locks

### Access timer

The access timer, one of the electronic accessories for the lock models E4000, E4000R, E6000R and TeamLock 4, allows the accurately timed, programmed access to the electronic locking system. It can be combined with any of the other optional electronic equipment. The battery-operated module, which is mounted in a lockable container, consists of an input keypad and an LCD. Up to eight independent timers can be set to "on" or "off" in a weekly cycle (after an "off-setting", the lock cannot be opened). The possibility of linking groups of days results in a large number of switching variants. The access timer is capable of 96 clock-controlled switches in a single week. Each timer can be input with an "on" and an "off"-setting for:

- each week day individually;
- all working days from Monday through Friday;
- the weekend, i.e. Saturdays and Sundays;
- all days of the week.
